

The art of interconnecting. Perfected by Weiss.

The CHIRON family of cables represents our dedication to quality even external to the equipment we build. CHIRON cables have been developed with utmost transparency as the main design goal.

Both the analog and digital balanced interconnects with XLR connectors are unshielded for very low stray capacitance effects. They exhibit cable geometries with extremely tight tolerances for a constant impedance curve.

The speaker cables use RF litz wire which suppresses the skin effect to a great degree. This results in a constant resistance across the whole audio band and beyond.

CHIRON cables use Nomex sleeves for excellent mechanical durability.

Connectors are gold plated and manufactured to tight tolerances.

Weiss Engineering is a Swiss company well known for its top quality Professional Audio products since 1985. The wealth of experience we have gained in years of designing products for Mastering Engineers has been applied to produce exceptional High-End HiFi products. Our mission is to produce equipment that becomes classic right from the outset: outstanding in sonics and design.

Technical Details:

CHIRON-Digital1 is a AES/EBU interconnect for 110 Ohm balanced XLR connections. The cable is not shielded. Standard lengths are 1, 2 and 3 meters. Any length available on order.

CHIRON-Analog1 is a interconnect for analog connections with XLR connectors. The cable is not shielded. Standard lengths are 1, 2 and 3 meters. Any length available on order.

CHIRON-Speaker1 is a speaker interconnect with spades on both ends. Two separate cables are used for a single connection. Standard lengths are 1, 2 and 3 meters. Any length available on order.
